

Wholesale Traceability Data-Sharing Policy

Rules for externally shared Origin Passport and shipment traceability data

Policy ID: DG-TR-004 · **Version:** 2.1 · **Effective:** 2026-03-01
Owner: Data Governance Council · **Applies to:** Sourcing, Production, Quality, Wholesale Operations, Engineering, Support

1. Purpose

This policy defines which Cocoarynth traceability information may be shared with wholesale partners, which information must remain internal, and which information requires separate approval. It supports transparent sourcing without exposing personal, commercially sensitive, or internal deliberative data.

2. Scope

The policy applies to Origin Passports, retailer integration files, shipment attachments, support responses, and other structured or unstructured disclosures of cacao-origin and production information to wholesale recipients. It applies regardless of transport format.

Minimum necessary rule: Share only fields needed for the approved wholesale purpose. A field being eligible for sharing does not require its inclusion in every export.

3. Data classifications

A. Approved traceability fields

The following fields may be shared for an approved traceability purpose when their values have passed the relevant operational review.

Field category	Examples	Conditions
Passport identity	Origin Passport ID, replacement or version reference	Use approved external identifiers.
Product and batch	Product name, finished batch number, cacao percentage	Must match shipment and product records.
Cacao origin	Country, growing region, producer or cooperative name, harvest year	Use the approved sourcing record and agreed producer naming.
Certification	Certification status applicable to the origin lot	Share only current approved wording; do not imply certification beyond its scope.
Production and shipment	Production date, shipment date	Share dates needed to connect the finished batch to its delivery.

B. Internal-only fields

The following information must not be included in wholesale traceability exports or routine retailer support responses.

Field category	Examples	Reason
Commercial terms	Negotiated cacao prices, supplier rates, payment terms, margins	Commercially confidential.
Internal quality material	Quality notes, tasting deliberations, non-public defect assessments	Internal operational analysis.
Employee collaboration	Employee comments, reviewer notes, internal messages	Not part of the approved traceability record.
Security and system data	Credentials, access tokens, private record keys, debugging output	Security-sensitive and unnecessary for the recipient.

C. Separate approval required

The following information may be disclosed only when Data Governance and the responsible business owner approve a documented purpose and channel.

Field category	Examples	Approval considerations
Personal contact information	Producer phone number, personal email, home or precise personal address	Consent, purpose, minimization, recipient, retention.
Non-public commercial information	Contract volumes, special terms, forward commitments	Contract restrictions and commercial owner approval.
Precise location data	Farm coordinates or household-level location	Producer safety, consent, and necessity.
Supporting documents	Certificates containing extra names or identifiers	Redaction and permitted-use review.

4. Origin Passport baseline

A standard wholesale Origin Passport may contain the passport ID, product name, batch number, country, growing region, producer or cooperative name, harvest year, cacao percentage, certification status, production date, and shipment date. This baseline is compatible with the approved traceability classification above.

Supplier pricing, producer contact details, internal quality notes, and employee comments are not part of the baseline and must remain excluded.

5. Responsibilities

- **Data owners** approve purposes and field classifications.
- **Sourcing and Quality** approve the relevant origin and certification facts.
- **Wholesale Operations** confirms that the recipient and shipment are authorized.
- **Engineering** implements field allowlists and tests that prohibited fields are absent.
- **Support** uses approved artifacts and avoids copying internal records into retailer responses.

6. Sharing controls

1. Confirm the wholesale purpose and intended recipient.
2. Select the approved schema or artifact for that purpose.
3. Verify data against the governed source records.

4. Check that no internal-only or unapproved fields are present.
5. Use the approved transfer channel and retain the required issuance record.
6. Escalate uncertain classifications before disclosure.

7. Corrections and incidents

Correct externally shared traceability information through the approved replacement process; do not silently alter an issued historical record. Suspected disclosure of internal-only, personal, commercial, or security information must be reported immediately through Cocoarynth's data incident process. Do not resend or further distribute the affected file while review is pending.

8. Interpretation

This policy determines whether information may be shared. A partner's integration requirements determine which permitted fields and formats are needed for a particular engagement. Product code or an issue tracker determines what the application currently implements. Those sources serve different purposes and must not be treated as interchangeable.
